TITLE: Observations concerning the G-penicillin recovered from residual waters

SOURCE: Revista de chimie, v. 16, no. 3, 1965, 166-167

TOPIC TAGS: penicillin, chemical precipitation, recrystallization, paper chromatography, spectrophotometric analysis

ABSTRACT: The authors note that the penicillin G recovered by means of N,N-dibenzylethylenediamine salt from the mother liquor after precipitation of the mother product must be recrystallized in order to obtain a time-stable product free of foreign penicillins and decomposition products. To analyze the purity of the samples, they suggest spectrophotometric measurements of the absorption at 322 millimicrons as well as at 263 and 280 millimicrons in order to detect degradation products, and paper chromatography to detect foreign penicillins. Budak, B. M. **Dispersive dynamical systems.** Vestnik
Moskov. Univ. 1947, no. 8, 135-137 (1947). (Russian)

This is a short summary of the author's Moscow thesis. Let R_n be Euclidean n -space. With a differential system $dx/dt = \chi(x)$, where x and X are n -vectors, there is associated a family of mappings $f(p, t): R_n \rightarrow R_n$, one and only one mapping corresponds to a given point t of the real line $L: -\infty \leq t < +\infty$. Let now R be any metric space, A and B two subsets of R , $U(B, \epsilon)$ an ϵ -neighborhood of B , and define

$$\tilde{\alpha}(A, B) = \inf \{ \epsilon | A \subset U(B, \epsilon) \};$$

$$\alpha(A, B) = \max \{ \tilde{\alpha}(A, B), \tilde{\alpha}(B, A) \}.$$

A dispersive dynamical system is a family of transformations (not necessarily single-valued) $f(p, t): R \rightarrow R$ defined for each $t \in L$ and satisfying the following conditions: (I) $f(p, 0)$ is the identity; (II) $f(p, \lambda)$ is a nonempty compactum; (III)

$g(f(p, t))$ implies $p \in f(q, -t)$; (IV) $f(f(p, t_1), t_2) = f(p, t_1 + t_2)$; (V) if $t = t_0$, then $\alpha(f(p, t), f(p, t_0)) = 0$ whatever $t_0 \in L$ and $p \in R$; (VI) if $p = p_0$ and $t = t_0$, then $\tilde{\alpha}(f(p, t), f(p_0, t_0)) = 0$ whatever $p_0 \in R$ and $t_0 \in L$. A motion through p is a mapping $\varphi_p(t): L \rightarrow R$ such that (a) $\varphi_p(0) = p$; (b) if $t^* < t^{**}$ then $\varphi_p(t^{**}) \in f(\varphi_p(t^*), t^{**} - t^*)$. The set $\varphi_p(L)$ is the trajectory through p . The motion $\varphi_p(t)$ is dynamically congruent to $\varphi_p(t')$ whenever there is a t'' such that $\varphi_p(t) = \varphi_p(t'' + t')$ for all $t \in L$. The ordinary dynamical systems in R_n are dispersive. The author gives criteria for the existence of noncongruent motions on one and the same trajectory and gives examples of such noncongruent motions. Many of the well-known results of G. D. Birkhoff, among others, are extended to dispersive systems. Properties of α - and ω -limiting sets are investigated.

S. Lefschetz (Princeton, N. J.).

BUDAK, B.M.

1-FW

Budak, B. M. The concept of motion in a generalized
dynamical system. Moskov. Gos. Univ. Uč. Zap. 155,
Mat. 5 (1952), 174-194. (Russian)

A dispersive dynamical system is a family $f(p, t)$
 $(-\infty < t < \infty)$ of one-many mappings of a complete
separable metric space into itself, satisfying six conditions,
for which see the review of an earlier paper by the author
[Vestnik Moskov. Univ., 1947, no. 6, 135-137, MR 10,
309], where the definition of a motion $\varphi_p(t)$ through p is
also given. An ordinary dynamical system $dx/dt = X(x)$
in n -space, X merely continuous, is shown to be an ex-
ample of a dispersive system, where $f(p, t)$ is the set of
points reached at time t on some solution curve starting
from p . A point p is called a point of continuity of the
system if $\alpha(f(p_n, t_n), f(p, t)) \rightarrow 0$ whenever $p_n \rightarrow p$ and $t_n \rightarrow t$,
where $\alpha(A, B)$ denotes the infimum of the positive num-
bers ϵ such that each of the sets A and B is contained in
the ϵ -neighborhood of the other. The results are largely
concerned with the existence and convergence of motions
under various hypotheses. Typical are: Theorem 1. If
 $q \in f(p, t)$ there exists a segment of a motion joining p to q .
Theorem 5. If p and the points of a motion $\varphi_p(t)$ corre-
sponding to some set of t -values dense on the real line I

Budak, B. M.

are points of continuity of the system, then for any sequence p_n converging to p there exist motions $\varphi_{p_n}(t)$ issuing from these points which converge uniformly to $p_*(t)$ on any finite t -interval. Other results concern the compactness or connectedness of the funnel (orbit) (p, J) with vertex p , ω or ω -limiting sets, and quasi-invariant sets F , of two types according as $FC(F, t)$ or $FD(F, t)$ for all t . — J. C. Oxtoby (Bryn Mawr, Pa.).

Budak, B. M. On the solution of boundary problems of parabolic type. Vestnik Moskov. Univ. 10 (1955), no. 8, 33-38. (Russian)

Theorem: For $i=1, 2, 3$, let $U_i(t, x)$ be a solution of the problem: (1) $[\partial/\partial t + f_i(t, x, \partial/\partial x)]U_i = 0$ in D_i for $0 < t < \infty$; (2) $U_i = \Phi_i$ in D_i for $t=0$; (3) $[\Lambda_i(t, x, \partial/\partial x)]U_i = 0$ on Σ_i for $0 < t < \infty$; where D_i is a domain in Euclidean n -space with a "piecewise smooth" (this term is defined and discussed in detail in the paper) boundary Σ_i , and f_i and Λ_i are linear in x, t , and derivatives of arbitrary order in x_1, \dots, x_n . Then the product $U = U_1 U_2 U_3$, defined on $D = D_1 \times D_2 \times D_3$, is a solution of the problem: (1) $[\partial/\partial t + f_1 + f_2 + f_3]U = 0$ in D for $0 < t < \infty$; (2) $U = \Phi_1 \Phi_2 \Phi_3$ in D for $t=0$; (3) $\Lambda_1(U) = 0$ on $\Gamma_1 = \Sigma_1 \times D_2 \times D_3$ for $0 < t < \infty$, and analogously for $i=2, 3$.

The theorem can be used to solve certain problems for the heat equation. J. Cronin (Southbridge, Mass.).

SUBJECT USSR/MATHEMATICS/Differential equations CARD 1/1 PG - 608
AUTHOR BUDAK, B.M., SAMARSKIJ A.A., TICHENOV A.N.
TITLE Collection of problems for mathematical physics.
PERIODICAL Moscow: State publication for technical-theoretical literature
684 p. (1956)
reviewed 2/1957

This collection originates in a textbook of Samarskij and Tichonov (The equations of mathematical physics, Moscow 1953) and a smaller collection of problems of Budak (Collection of problems for mathematical physics, MGU-MMI (1952)). But this material is still extended, especially it is represented in a detailed manner. 130 pages contain problems and questions and 580 pages contain solutions and instructions for solutions. Only boundary value problems for partial differential equations of second order are treated. The knowledge of the general theory is assumed. In three chapters the three types of equations are treated, the chapters are subdivided according to methods to be applied. There follow again three chapters with the same subdivision which treat essentially more difficult questions. An important part of the problem consists in deriving the differential equation and its boundary conditions from the given physical problem. The method of solution is given so detailed that a self-study for students is possible. The book represents a source of wealth for the applied mathematician and for the theoretical physicist.

SUBJECT USSR/MATHEMATICS/Applied mathematics CARD 1/1 PG - 556
AUTHOR BUDAK B.M.
TITLE On the method of straight lines for the solution of some
boundary value problems.
PERIODICAL Vestnik. Moskovsk. Univ. 11, 1, 3-12 (1956)
reviewed 2/1957

The author considers the solution of the boundary value problems for the equations

$$u_{xy} = a(x,y)u + f(x,y)$$

$$u_{yy} = A(x,y,u)$$

$$g(x)u_{tt} = (\sigma(x)u_x)_x - q(x)u + f(x,t)$$

$$g(x)u_t = (\sigma(x)u_x)_x - q(x)u + f(x,t)$$

and for some systems by aid of the method of straight lines due to Michlin
and gives estimations for the appearing errors.

INSTITUTION: Lomonossov University, Moscow.

SUBJECT USSR/MATHEMATICS/Theory of approximations CARD 1/2 PG - 344
AUTHOR BUDAK B.M.
TITLE On the straight line method for some boundary value problems.
PERIODICAL Doklady Akad. Nauk 109, 9-12 (1956)
reviewed 10/1956

Let be given the boundary value problem

$$u_{xy} = a(x,y)u + f(x,y), \quad x_0 \leq x \leq X, \quad y_0 \leq y \leq Y$$

$$u(x_0, y) = \varphi(y), \quad y_0 \leq y \leq Y$$

$$u(x, y_0) = \psi(x), \quad x_0 \leq x \leq X, \quad \varphi(y_0) = \psi(x_0).$$

Approximative values of the solution on the straight lines $x = x_k = kh$ ($(n+1)h = X - x_0$, $k=1,2,\dots,n$) can be obtained by solving the system of ordinary differential equations

$$u'_{k+1}(y) = u'_k(y) + ha_k(y)u_k(y) + hf_k(y)$$

$$y_0 \leq y \leq Y, \quad k=0,1,2,\dots,n-1$$

$$a_k(y) = a(x_k, y), \quad f_k(y) = f(x_k, y)$$

Doklady Akad. Nauk 109, 9-12 (1956)

CARD 2/2

PG - 344

with the additional conditions

$$u_k(y_0) = \psi(x_k), \quad u_0(y) = \varphi(y).$$

Then $u(x_k, y) \approx u_k(y)$.

The author gives estimations of the error $|u(x_k, y) - u_k(y)|$ in this case and for similarly solved boundary value problems of the equations

$$u_{xy} = A(x, y, u), \quad g(x)u_{tt} = (\sigma(x)u_x)_x - q(x)u + f(x, t) \quad \text{and}$$

$$g(x)u_t = (\sigma'(x)u_x)_x - q(x)u + f(x, t).$$

AUTHOR BUDAK B.M.
TITLE On the method of straight lines for boundary value problems
 for partial differential equations.
PERIODICAL Doklady Akad.Nauk 112, 187-190 (1957).
 reviewed 4/1957

Michlin's method of straight lines, treated by the author already several times, here is used for the approximate solution of certain partial differential equations (Goursat, telegraph equation etc.). The convergence of the method is proved and its errors are estimated.

INSTITUTION: Lomonossov University, Moscow.

AUTHOR: BUDAK, B.M., GORBUNOV, A.D. 20-4-3/52
TITLE: On the Difference Method for the Solution of the Nonlinear
Goursat Problem (O raznostnom metode resheniya nelineynoy
zadachi Gursa). SSSR/
PERIODICAL: Doklady Akademii Nauk, 1957, Vol 117, Nr 4, pp 559-562 (USSR)
ABSTRACT: The authors use the Difference method for the solution of the
Goursat problem

$u_{xy} = f(x, y, u, u_x, u_y),$
 $u(x, 0) = \varphi(x); \quad 0 \leq x \leq l_x; \quad u(0, y) = \psi(y), \quad 0 \leq y \leq l_y; \quad \varphi(0) = \psi(0)$

for an arbitrary right side $f(x, y, u, u_x, u_y)$ which only in the
region of definition $0 \leq x \leq l_x, \quad 0 \leq y \leq l_y, \quad |u - u^0| \leq l_n,$

$|u_x - u_x^0| \leq l_{u_x}, \quad |u_y - u_y^0| \leq l_{u_y}$ is assumed to be continuous in all
arguments and in u, u_x, u_y it is assumed to be sufficiently
smooth. The functions $\varphi(x)$ and $\psi(y)$ are continuously differentiable.
With the aid of a general criterion of convergence it is stated
that if f satisfies the Lipschitz condition in u_x and u_y , then

Card 1/2

, On the Difference Method for the Solution of the Nonlinear Goursat Problem 20-4-3/52

the problem has a continuously differentiable solution. If the Lipschitz condition is satisfied also in u , then the solution is unique. For the case that f , $\varphi'(x)$ and $\psi'(y)$ satisfy the Lipschitz condition in all arguments, the error is estimated by the steps in x and y and by the maximal values of the functions and their derivatives and by the Lipschitz constant. Finally the results are extended to a system of equations in the m -dimensional space. 3 Soviet and 3 foreign references are quoted.

TITLE:

On the Convergence of Some Difference Methods for the Equations
 $y' = f(x, y)$ and $y'(x) = f[x, y(x), y(x-\tau(x))]$ (Oakhodimosti
 nekotorykh konechno-raznostnykh protsessov dlya uravneniy
 $y' = f(x, y)$ i $y'(x) = f[x, y(x), y(x-\tau(x))]$)

PERIODICAL: Vestnik Moskovskogo universiteta, Seriya fiziko-matematicheskikh i
 yestestvennykh nauk, 1958, Nr 1, pp 23-32 (USSR)

ABSTRACT:

Given the problem

(1) $y' = f(x, y),$

(2) $y(x_0) = y_0 \quad (x_0, y_0) \in G.$

The approximate values y_i of y are obtained from the difference equation

(3) $\sum_{i=0}^m \alpha_i y_{k-i} = h \sum_{i=0}^n \beta_i f_{k+1-i}, \quad f_i = f(x_i, y_i), \quad x_i = x_0 + ih,$

where the initial conditions are prescribed by

(4) $y_i = g(x_i),$

where $g(x)$ is a continuously differentiable function changing with h .
 Furthermore the difference equation

Card 1/3

On the Convergence of Some Difference Methods for the SOV/55-58-1-2/33
 Equations $y' = f(x, y)$ and $y'(x) = f[x, y(x), y(x - \tau(x))]$

$$(5) \quad \sum_{i=0}^{m-1} (\alpha_0 + \dots + \alpha_i) \psi(x_{k-i}) = h \psi(x_k)$$

is considered, where $\psi(x_k)$ is defined and finite in the points x_k , $\|\psi\| = \max |\psi(x_k)|$. Let the solution of (5) be written in the form $\varphi_k = h B_h \psi_k$, where B_h is a linear bounded operator,

$$\|B_h\| = \max_{0 \leq k \leq N_h} \sum_{i=0}^{h-1} |\gamma_{ki}|, \quad N_h = \left[\frac{x-x_0}{h} \right], \quad \gamma_{ki} \text{ is determined by a}$$

fundamental solution of the homogeneous equation (5).

Theorem: Let the coefficients of (3) satisfy the conditions

$$\sum_{i=0}^m \alpha_i = 0, \quad \sum_{i=0}^{m-1} (\alpha_0 + \dots + \alpha_i) = \sum_{i=0}^n \beta_i \neq 0.$$

For the uniform convergence of the difference process defined by (3) it is necessary and sufficient that $\|B_h\|$ is uniformly bounded in h , that the absolute values of the simple roots of

astronomii, fiziki, khimii, 1958, Nr 3, pp 3-12 (USSR)

ABSTRACT:

The method of straight lines already applied for several times by the authors [Ref 1-3] is used in order to prove the existence, uniqueness and continuous dependence on the boundary conditions of the solution of the following boundary value problem : A continuously differentiable solution of the equation $u_{xy} = f(x,y,u, u_x, u_y)$ is to be found which satisfies the boundary conditions $u(x,g(x)) = \varphi(x)$, $0 \leq x \leq l_x$; $u(0,y) = \psi(y)$, $0 \leq y \leq l_y$. Here f is defined and continuous in \bar{g} : $0 \leq x \leq l_x$, $g(x) \leq y \leq l_y$, $|u| \leq l_u$, $|u_x| \leq l_{u_x}$, $|u_y| \leq l_{u_y}$ and satisfies the Lipschitz conditions with respect to u_x and u_y ; $g'(x) \geq 0$ for

PERIODICAL: Doklady Akademii Nauk, 1958, Vol 118, Nr 5, pp 858-861 (USSR)
ABSTRACT: The authors consider the equation
(1) $u_{xy} = f(x, y, u, u_x, u_y)$
in the domain
 $G : 0 \leq x \leq l_x, g(x) \leq y \leq l_y, |u| \leq l_u, |u_x| \leq l_{u_x}, |u_y| \leq l_{u_y},$
where $g(x) > 0$ for $0 < x < l_x$ and $g'(x) > 0$ is continuous.
It is assumed that f is continuous in \bar{G} and satisfies the Lipschitz condition with respect to u_x and u_y . A continuously differentiable solution is sought which satisfies the boundary conditions
(2) $u(x, g(x)) = \varphi(x), 0 \leq x \leq l_x; u(0, y) = \psi(y), 0 \leq y \leq l_y$

Card 1 / 2

Straight-Line Method for the Solution of a Non-linear Boundary Value Problem in a Domain With Curvilinear Boundary 20-118-5-2/59

where $\varphi'(x)$ and $\psi'(y)$ are continuous and $M\varphi + 2M\psi < l_u$,
 $M\varphi_1 + M\varphi_2, M_g < l_{u_x}$, $M\varphi < l_u$, $M\psi < l_{u_y}$, where $M\varphi, \dots$ denotes

the upper bound of the modulus of φ, \dots

Under these assumptions the existence of at least one solution is proved with the aid of the straight-line method. Under additional conditions the uniqueness and continuous dependence on the boundary conditions is shown and the error of the approximative solution is estimated. There are 3 Soviet references.

 (O skhodimosti nekotorykh konechnoraznostnykh protsessov dlya
 uravneniy $y' = f(x, y)$ i $y'(x) = f(x, y(x), y(x-\tau(x)))$)

PERIODICAL:

Doklady Akademii Nauk SSSR, Vol 119, Nr 4, pp 644-647 (USSR)

ABSTRACT:

Let the equation $y' = f(x, y)$ and the initial condition
 $y(x_0) = y_0$, $(x_0, y_0) \in G$ be given. Let y_i denote the approxi-
 mative value of the ordinate $y(x_i)$ of the solution in the
 points $x_i = x_0 + ih$.

Theorem: If a difference process defined by the equation

$$\sum_{i=0}^m \alpha_i y_{k-i} = h \sum_{i=0}^n \beta_i f_{k+i} + e - i, \quad f_j = f(x_j, y_j)$$

converges, then the following conditions are satisfied:

$$\sum_{i=0}^m \alpha_i = 0 \quad \sum_{i=0}^{m-1} \sum_{j=0}^i \alpha_j = \sum_{i=0}^n \beta_i \neq 0$$

On the Convergence of Some Different Processes for
the Equations $y' = f(x, y)$ and $y'(x) = f(x, y(x), y(x-t(x)))$ 20-119-4-5/59

In a second theorem necessary and sufficient conditions for
the uniform convergence are set up, e.g. The absolute values
of the simple roots of the characteristic equation

$$\sum_{i=0}^{m-1} \sum_{j=0}^i a_j \lambda^{m-1-i} = 0$$

must be < 1 and the absolute values of the multiple roots
must be < 1 .

Several special cases are considered. There are 9 references,
6 of which are Soviet, 1 German, 1 American and 1 Swiss.

TITLE: Numerical solution of a boundary problem for the system of nonlinear integro-differential equations of a supersonic boundary layer

SOURCE: Moscow. Universitet. Vy'chislitel'nyy tsentr. Sbornik rabot, no. 2, 1963. Chislennyye metody v gazovoy dinamike, 146-161

TOPIC TAGS: boundary value problem, integrodifferential equation, nonlinear equation, supersonic boundary layer, body of revolution, numerical method, computing process scheme, iteration method, variable step net, numerical method convergence, boundary layer, axisymmetric flow, viscous fluid flow

ABSTRACT: A system of equations describing a supersonic boundary layer on a slender body of revolution within an axially symmetric flow of a viscous, heat-conducting gas is rewritten in Dorodnitsyn variables ξ and n , and the boundary conditions under which the system is to be solved are established. The solution of the boundary value

Card 1/3

ACCESSION NR: AT4006714

problem is sought in the form:

$$u = \psi(\xi), i = i(\xi), \xi = \frac{\sqrt{R} n}{2M\sqrt{k}}, \quad (1)$$

where u and i are velocity and enthalpy functions of the boundary layer respectively, R is the Reynolds number, and M is the Mach number. After substituting (1) into the system of equations and boundary conditions, the boundary value problem for Volterra's nonlinear integro-differential equation is derived. It is to be solved simultaneously with the cubic equation expressing the condition for the existence of solutions of (1). An iterative difference method is used to solve the problem. The scheme for the difference approximation of the boundary value problem and the iterative process for solving it are described in detail. Peculiarities of difference approximations of the derivatives, integrals, and particular blocks of the calculation process are presented. Problems of selecting given functions, constants, and initial approximations, also their effect on the number of

Card 2/3

ACCESSION NR: AT4006714

iterations needed to attain a given accuracy of approximation, are analyzed. In order to test this method, the known Blasius case of a boundary layer was calculated and results compared with ones derived by other numerical methods. A series of particular variants of the problem are calculated by means of the described method, and the results are analyzed. Orig. art. has: 47 formulas and 4 figures.

Chislennyye metody v gazovoy dinamike (Numerical methods in gas dynamics), 139-183

TOPIC TAGS: boundary value problem, difference method, heat conduction, Stefan problem, nonlinear equation, iteration

ABSTRACT: In a review of studies on the problem, the present paper starts with an investigation of difference methods for the solution of single-phase and two-phase Stefan-type problems for the nonlinear parabolic equation with sufficiently generalized nonlinear boundary conditions. For the numerical solutions to these problems the authors propose the use of implicit difference expressions with the phase front trapped at the difference lattice point and the application of the iteration method. Using certain auxiliary limitations imposed on the problem they show also that the approximate solutions converge to the respective (classical) solutions, and this is viewed as the existence proof of such solutions. The article offers a description of numerous existing difference methods for

Card 1/2

(Moscow)TITLE: Difference method with smoothing of coefficients for solving Stefan B problemsSOURCE: Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki, v. 5,
no. 5, 1965, 828-840

TOPIC TAGS: difference method, heat conductivity

ABSTRACT: The existing methods for solving Stefan problems are unsuitable in the case of single-front problems where the unknown functions depend on several spatial coordinates and time. The author applies implicit difference schemes combined with smoothing of coefficients of the basic equation to the numerical solution of Stefan problems with any number of phase fronts and of independent variables. The smoothing of coefficients is used as a basis for theoretical consideration about proving the existence of solutions of differential equations with discontinuous coefficients and also for the proof of the existence of solutions of one-dimensional Stefan problems for the case of linear equations of heat

Card 1/2

BORG: Moscow State University im. M. V. Lomonsov (Moskovskiy gosudarvenny universitet)TITLE: Difference systems with rectification of fronts for solution of multifront problems of the Stefan type

SOURCE: AN SSSR. Doklady, v. 167, no. 4, 1966, 735-738

TOPIC TAGS: finite difference method, iterational method, approximation technique, gas dynamics, frontal zone

ABSTRACT: Difference systems are applied to the rectification of fronts in the one-dimensional case for a single parabolic equation. Transition from this case to the multidimensional case is not difficult. The problem with a constant number of phase fronts is stated in the following manner. The basic domain of variation of the independent variables (x, t) is the domain

$$D: (\tilde{y}(t) \leq x \leq \tilde{y}(t), t > 0),$$

where $x = \tilde{y}(t)$ and $x = \tilde{y}(t)$ are the left and right boundaries of the domain; these may be given curves or unknown phase fronts. Within the domain D there are N phase fronts $x = y_i(t)$, $i = 1, 2, \dots, N$, where

$$\tilde{y}(t) = y_0(t) < y_1(t) < \dots < y_N(t) < y_{N+1}(t) = \tilde{y}(t), \quad t \geq 0.$$

Card 1/3

UDC: 518.61

L 29839-66

ACC NR: AP6011421

If the boundary curves are given, the Stefan problem can be formulated as: find the functions $u_0(x, t), u_1(x, t), \dots, u_N(x, t)$ and the functions $x = y_1(t), \dots, x = y_N(t)$ satisfying the conditions

$$a(x, t, u_i) \frac{\partial u_i}{\partial x} = \frac{\partial}{\partial x} \left(k(x, t, u_i) \frac{\partial u_i}{\partial x} \right)$$

for $y_i(t) < x < y_{i+1}(t)$, $t > 0$, $i = 0, 1, \dots, N$;

$$\mu_1 k(x, t, u_0) \frac{\partial u_0}{\partial x} \Big|_{x=y_1(t)} = -\tilde{q}(t, u_0) \Big|_{x=y_1(t)}, \quad t > 0;$$

$$\mu_{II} k(x, t, u_N) \frac{\partial u_N}{\partial x} \Big|_{x=y_N(t)} = -\tilde{q}(t, u_N) \Big|_{x=y_N(t)}, \quad t > 0;$$

$$u_{i-1}(y_i(t), t) = u_i(y_i(t), t) = \Psi_i(y_i(t), t), \quad t > 0, \quad i = 1, 2, \dots, N;$$

$$\begin{aligned} \gamma_i(y_i(t), t, \Psi_i(y_i(t), t)) dy_i/dt &= k(x, t, u_i) \frac{\partial u_i}{\partial x} \Big|_{x=y_i(t)} + \\ &- k(x, t, u_{i-1}) \frac{\partial u_{i-1}}{\partial x} \Big|_{x=y_i(t)} + \Phi_i(y_i(t), t, \Psi_i(y_i(t), t)), \end{aligned}$$

$t > 0$, $i = 1, 2, \dots, N$;

$$y_i(0) = l_i, \quad i = 0, 1, \dots, N, N+1;$$

$$u_i(x, 0) = \varphi(x), \quad l_i \leq x \leq l_{i+1}, \quad i = 0, 1, \dots, N.$$

The parameters u_I and u_{II} may be 0 or 1, and the functions $\tilde{q}(t, u_0)$ and $\tilde{q}(t, u_N)$ may be zero as well as nonzero. A substitution for the independent variable is made such that the problem is defined in the coordinates (ζ, t) where

$$\zeta_i = (x - y_i(t)) / (y_{i+1}(t) - y_i(t)), \quad t = t, \quad i = 0, 1, \dots, N.$$
